Fixed Prosthodontics in Dental Practice

1. "Fixed prosthodontics has undergone many changes in recent times with significant developments in dental materials and principles of adhesive dentistry. The practice of fixed prosthodontics has opened new avenues to patients and has brought new opportunities for dentists. The changes have been driven by technological advancements, increased awareness of the importance of oral health, and the need for more aesthetically pleasing and functional restorations."

2. "In the 1980s, the trend towards adhesive dentistry led to a paradigm shift in the approach to fixed prosthodontics. Crowns were replaced by adhesive restorations, which were perceived as more natural-looking and easier to maintain. This change was facilitated by the introduction of new dental materials and bonding technologies, as well as improved methods for preparing teeth for restoration."

3. "The 1990s saw a further evolution in fixed prosthodontics with the introduction of CAD/CAM technologies, which allowed for the production of custom-made prostheses with high precision. This led to an increase in the demand for aesthetically pleasing and functional restorations, which in turn drove the development of new materials and techniques."

4. "In recent years, the focus in fixed prosthodontics has shifted towards the concept of "bioengineering," which aims to create restorations that mimic the natural tooth environment as closely as possible. This approach involves the use of biocompatible materials and the development of new bonding systems that enhance the bond strength and durability of adhesive restorations."
